

Technical Installation Guide

The Rolling Capstones

27 September 2024

1 Welcome to the future of Trip Planning

The AI Trip Creator leverages the power of an OpenAI model that, combined with your input and prompts, creates travel plans and an itinerary for your trip.

2 Technology Requirements

The Web Application has been created for use on laptops and desktop computers – later updates will make it compatible with mobile devices. If you're using a computer with Windows, Linux, Solaris, or macOS installed, your device should comply with the following:

- 4GB of RAM or more.
- Windows 10 or later (for Windows users).
- Ubuntu 16.04 or later (There are different versions of the Ubuntu operating system. See additional resources on the internet).
- MacOS 11 or later.
- Solaris version 7 or later.

3 Installation Steps

As of this writing, the final (production-ready) web application has been deployed. The application has not been commercialized and it cannot be downloaded or installed from any App Store, such as Google Play or the Apple App Store.

The application can be installed by downloading it from the GitHub repository and ensuring that all the libraries and frameworks needed to run the application are installed.

Access to the web application is possible only by using the link to the deployed version until such a time that the GitHub repository or application is made available to the public.
